

Global Capgemini AI hackathon on Microsoft AI Platforms.

Agentic Industry Hackathon 2026

AI building AI: accelerate industry agents with Microsoft + Capgemini.

Combine the power of Microsoft's AI platforms with Capgemini's deep industry expertise and turn bold ideas into working agentic solutions.

Clemens Reijnen, H1 - 2026

Capgemini 

Agentic Industry Studio Hackathon 2026

A Global Capgemini Microsoft Hackathon

The Studio Hackathon 2026 is your chance to lead the future of innovation!

This experience is designed to empower Capgemini colleagues and client teams to deepen knowledge and gain hands-on skills by **building and accelerating intelligent applications** using Microsoft and GitHub technologies.

Don't miss this opportunity to supercharge your ideas. Throughout the hackathon, teams will fast-track POCs and demos with access to powerful tools like **Azure, Microsoft Foundry, Microsoft Fabric, GitHub Copilot, M365 Copilot, Copilot Studio and Dynamics Copilot's**.

Participants will receive **exclusive training and dedicated support** from Microsoft and GitHub experts, ensuring you're fully prepared to succeed.

This is the moment to collaborate, innovate, and apply AI to real-industry challenges that matter.

Submissions will be evaluated on how boldly teams embrace the full capabilities of Microsoft AI Platforms and, on the impact and quality of the industry intelligent application.

Ready to make your mark? Join the Agentic Industry Studio Hackathon 2026 and shape the future today!

Studio Hackathon 2026 leads in innovation!

In just four weeks, teams will build intelligent apps using all Microsoft AI platforms, fast-track POCs with powerful tools, and get exclusive training and expert support.

Don't miss this opportunity to collaborate, innovate, and tackle real-industry AI challenges.

OBJECTIVES

UPSKILLING

- Equip Capgemini teams with advanced knowledge and hands-on experience in AI-driven development using Microsoft and GitHub technologies.
- Builds technical expertise, strengthens workforce capabilities, and positions Capgemini as a trusted innovation partner.

CAPGEMINI DEMO, POCS, IP

- Develop tangible prototypes and demos that showcase intelligent applications leveraging modern tools and practices.
- Generate reusable assets, frameworks, and intellectual property during the hackathon to support future projects and offerings.
- Accelerates solution validation, enhances go-to-market readiness, and demonstrates innovation leadership to clients.

CLIENT INTIMACY BYO Client UC

- Foster deeper collaboration and co-innovation with clients by working together on real-world challenges during the hackathon.
- Strengthens strategic relationships, increases client trust, and creates opportunities for long-term partnerships and joint innovation.
- Test the client ideas in a free risk environment to confirm its feasibility
- Take away a prototype free of charge that can be used for their own purposes

Environments for your use case implementation

- A. GitHub + Azure + optional Microsoft Fabric
- B. M365 Copilot + Copilot Studio + Power Platform + optional GitHub + Azure
- C. Dynamics 365 + Copilot Studio + Power Platform + optional GitHub and Azure
- D. GitHub + Azure + Mistral

Use Cases Templates for the Hackathon

Public Sector Healthcare: AI-Enabled Patient Triage and Administrative Support

Automated assistants to handle routine tasks, schedule appointments, and support clinical decisions.

Financial Services: AI Compliance Assistant and Process Optimizer

A Private Banking portfolio review, also called the Data gathering stage, the goal is to transform raw, fragmented data into a strategic narrative.

Retail: Autonomous inventory management

AI Agents to redefine Autonomous Inventory Management to make demand prediction or replenishment orders more flexible

LS / Supply Chain : Predictive AI Agents

AI Agents through the GMP to ensure products are consistently made and controlled so they are safe, effective, and meet specifications.

Utilities Sector: An intelligent, resilient grid

AI Agents to run an intelligent, resilient grid while integrating volatile distributed renewables and keeping safety and power quality high.

Sales & Marketing: Campaign Management

AI Agents to plan, design, execute, and supervise campaigns across territories while proving impact.

Human Resources: Recruiting workflows and HR chatbots

AI automate recruiting workflows power HR chatbots and improve hiring efficiency and employee support.

Procurement: Compliant sourcing to execution

AI Agents to manage RFPs and supplier Q&A, ensure contracts follow standard clauses, with minimal rework.

Technology / IT: Agentic SDLC

AI Agents coding co-pilot to accelerate development and as an autonomous assistant in IT operations

Technology / IT: AI-powered Employee Experience

AI-powered, multimodal, and proactive agents to unify onboarding, workplace interactions, and knowledge access.

BYO Client Use Case

Clients bring a business challenge or use case, and our Capgemini team build a prototype to validate its feasibility.

Public Sector Healthcare: AI-Enabled Patient Triage and Administrative Support

Problem Statement: Overburdened medical staff and heavy paperwork lead to slower patient service and clinician burnout. Automated assistants (like triage bots and documentation aides) can handle routine tasks, schedule appointments, and support clinical decisions, easing administrative burdens and improving patient care.

Develop a multi-agent system on Azure to streamline patient triage and care coordination. Using a code-first approach with frameworks like Microsoft's Agent Framework, implement specialized agents for tasks such as symptom checking, priority classification, diagnostics assistance, care planning, and appointment scheduling.

Domain Knowledge
Approach
- Clinical Insights -

Use Microsoft 365 Copilot in Outlook/Teams to auto-summarize doctor-patient conversations, draft clinical reports, and manage referrals. Through Copilot Studio and Power Platform, build low-code virtual health assistants (e.g. a patient Q&A chatbot or an internal "clinical assistant") that handle common inquiries and paperwork, freeing clinicians to focus on direct patient care.

Enterprise Workflow
Orchestrator Approach
- Patient Support Virtual Nurse -

Integrate Dynamics 365 Healthcare modules with Copilot to automate patient intake, appointment reminders, claims processing, and call-center support. Make Copilot summarize patient inquiries and suggest next steps for staff, auto-fill insurance forms through Azure Functions, streamlining operations and reducing errors.

Decision Intelligence
Platform Approach
- Care Insights -

Fine-tune an open-source Mistral language model on medical texts, EHR data, and clinical guidelines to build a HIPAA-compliant medical AI assistant. Make this custom model (trained and deployed on Azure) answer complex medical questions, provide decision support with accurate references, and generate patient-friendly explanations of clinical information.

Custom Decision
Support Approach
- Patient Support -

Financial Services: AI Compliance Assistant and Process Optimizer

Problem Statement: In the Pre-Review stage of a Private Banking portfolio review, also called the Data gathering stage, the goal is to transform raw, fragmented data into a strategic narrative. This stage is the "behind-the-scenes" engine room where the heavy lifting happens. Before the Relationship Manager (RM) even picks up the phone, a team of analysts and investment specialists spends hours ensuring the data is bulletproof. Here are four scenarios showing how Microsoft's AI ecosystem can automate and enhance this "engine room" work.

Develop AI agents that works consolidating multi-entity data and performing performance attribution. Using Microsoft AI Foundry to build a custom "Portfolio Intelligence Agent." Instead of an analyst manually pulling reports from three different sub-entities (e.g., a family trust, a personal account, and a corporate holding), the agent access internal documents, query internal SQL databases and external market APIs simultaneously.

Data Orchestrator
Approach
- RM Insights -

Turning technical analysis into a client-ready narrative. Once the data is processed, the Relationship Manager (RM) uses Copilot to identify "Portfolio Drift." With a natural language prompt like "Highlight any asset class that is 5% away from our target 60/40 allocation," Copilot instantly flags the imbalances and drafts the executive summary using the performance data and the "House View" that highlight how is the exposure compared to the House View

Research Approach
- RM Assistant -

Integrate Dynamics 365 to identify "Actionable Moments" helping the RM to identify subtle "drifts" in a portfolio or life events that should trigger a change in strategy. I.e: The AI built into Dynamics 365 monitors the client's profile. If the portfolio's equity weight drifts 5% above the target due to market growth, or if the CRM detects a "Life Event" (like a liquidity event from a company sale), it automatically creates a "Prioritized Review Task" in the RM's dashboard with a pre-calculated suggestion: "Portfolio is overweight in Tech; suggest rebalancing \$2M into Fixed Income."

Portfolio awareness
Approach
- Event Driven -

Develop a secure in-house "House View GPT" by training a Mistral LLM on the bank's official stance on the economy (the "House View") to provide a deep, technical analysis of "Selection" vs. "Allocation" effects. I.e: A client asks, "Why did I underperform the benchmark by 2%?" and it analyzes the specific trades made and generates a technical report: "Underperformance was 80% due to the 'Selection Effect' in European Mid-Caps and 20% due to 'Cash Drag'." It then writes a compliant draft of the performance commentary in the bank's specific professional "voice."

Custom Analysis Approach
- RM Support -

Retail: Autonomous inventory management

Problem Statement: Retailers struggle with inventory management flexibility. Their goal using AI Agents would be to redefine Autonomous Inventory Management to make it more flexible by using: AI agent to monitor stock levels, predicts demand, and automatically triggers replenishment orders. And integrate with suppliers and logistics systems for real-time adjustments. And also Agents to reconfigure value chain workflows, objectives, and constraints in real time - pivoting between margin, sell-through, or service-level goals as conditions change. To quickly adapt to new assortments, promotions, policies, or partners via modular skills and connectors, with guardrails for safe rollout and rollback.

An AI Foundry multi-agent “inventory control tower” monitors stock, forecasts demand, and auto-creates replenishment orders, then switches goals (margin vs sell-through vs service level) when conditions change. Example: a heatwave spikes bottled-water demand, so it reallocates inventory and expedites POs. AI Foundry supports this by orchestrating agents + tool calls to ERP/WMS/suppliers with evaluation, monitoring, guardrails, and rollback

Autonomous Control
Tower Approach
- Inventory Assistant -

A Copilot Studio agent watches exceptions and proposes (or executes) replenishment actions through connectors. Example: it detects a promo item will stock out in 48 hours, asks for approval, then triggers a supplier reorder and a store transfer. Copilot Studio supports this with low-code agent design, ready connectors/actions, conversational explanations, and human-in-the-loop approvals for safe changes

Planner exception
- Demand Planner
Assistant -

Dynamics Supply Chain is the system of record, and an agent acts inside ERP processes to adjust plans in real time. Example: a supplier delays an ASN, so it updates lead times, re-runs planning, converts planned orders to POs, and reprioritizes allocations to top-service stores. Dynamics supports this with native inventory, procurement, and fulfillment workflows, transaction auditability, and controls for governed execution.

Purchase Planner
Approach
- Replenishment Copilot -

A Mistral fine-tuned model learns your assortment patterns, promo uplift, substitution rules, and supplier quirks to recommend better order quantities and constraint tradeoffs. Example: for a new SKU, it predicts launch demand using similar items and proposes MOQ-aware orders with fewer overstocks. Fine-tuning supports this by specializing the model on your historical demand/ops decisions, improving accuracy on edge cases, while versioning enables safe rollback

Precision forecasting
Approach
- Merchandising Support -

Problem Statement: In life sciences (pharma/biotech/medical devices), GMP is the set of regulated quality standards that ensure products are **consistently made and controlled** so they are **safe, effective, and meet specifications**. Operations teams must keep assets and batches within validated limits while juggling equipment health, preventive maintenance, and strict SOP/BPR compliance, so monitoring assets in real time, detecting early failure signals, optimizing “golden batch” parameters, and identifying potential deviations fast without disrupting production

Using Microsoft AI Foundry, an Operations Agent orchestrates agents that stream real-time sensor/SCADA data to detect early wear patterns and cross-check them against SOP/BPR “golden batch” limits.

Example: a vibration spike on a granulator triggers a predicted bearing failure alert plus a recommended PM plan and deviation-resolution playbook retrieved from validated SOPs. AI Foundry supports it with agent orchestration, RAG over controlled documents, evaluation, and governed deployment.

With Microsoft 365 Copilot Studio, a Teams-based “Maintenance Coach” lets technicians ask natural-language questions over approved SOPs and batch records to resolve deviations faster.

Example: “Line 2 is trending above torque—what’s the safe adjustment?” The copilot replies with the exact SOP step, required QA checks, and starts a guided checklist workflow to document actions. Copilot Studio supports it via low-code agent design, connectors (SharePoint/Power Automate), conversational UI, and controlled action execution.

Using Microsoft Dynamics (e.g., asset/field service), the Operations Copilot converts deviation risks into closed-loop execution.

Example: a deviation agent flags repeated micro-stoppages; the system automatically creates a work order, reserves spares, schedules the right technician, and updates the asset history once completed. Dynamics supports it with the operational data model (assets, work orders, inventory), scheduling, approvals, and auditable workflows—so AI recommendations become trackable actions aligned to compliance.

A Mistral LLM model is fine-tuned on the site’s historical alarms, maintenance notes, batch deviations, and resolution outcomes to improve root-cause and resolution-path accuracy in plant-specific language. Example: it learns that “BPR-17 drift + filter DP rise” usually indicates a specific clogging mode and suggests the proven fix sequence with expected recovery time. Fine-tuning supports it by boosting precision on local codes, abbreviations, and rare failure modes beyond generic models.

Predictive maintenance
Approach
- Operations Assistant -

Guided troubleshooting
Approach
- Maintenance Assistant -

Closed-loop work orders
Approach
- Operations Copilot -

Site-specific deviations
Approach
- Manufacturing Support -

Utilities Sector: An intelligent, resilient grid

Problem Statement: Utilities must run an intelligent, resilient grid while integrating volatile distributed renewables and keeping safety and power quality high. The challenge is to automate control-room supervision, anticipate contingencies, optimize energy flows and outages, and manage asset health in real time—then coordinate field workforce actions and DSO functions (flexibility, storage, capacity) quickly and auditable.

Using Microsoft AI Foundry, the Control Room of the Future orchestrates Network Resilience Agents that fuse SCADA/EMS/PMU signals with weather and DER telemetry to run contingency simulations and recommend corrective switching in seconds. Example: when wind output drops and a feeder overload is predicted, the agent proposes reconfiguration and voltage/VAR actions and alerts the operator with confidence and safety constraints. AI Foundry supports it with agent orchestration, governed data/RAG, evaluation, and monitored deployment.

With Microsoft 365 Copilot Studio, a Teams-based “Outage & Safety Copilot” guides dispatchers and field crews through standardized playbooks and live status. Example: “Transformer T-14 overheating—what’s the safe isolation and customer notification sequence?” The copilot returns the approved steps, starts a checklist, drafts customer messages, and opens a handover summary for the next shift. Copilot Studio supports it via low-code conversational agents, connectors (SharePoint/Power Automate), and controlled action workflows.

Using Microsoft Dynamics, AI recommendations become closed-loop execution across workforce, assets, and service tickets. Example: an Asset Availability Agent predicts a breaker failure; the system auto-creates a work order, checks spares, schedules the right crew, enforces safety permits, and updates asset history and compliance evidence after completion. Dynamics supports it with asset/work order data models, scheduling/dispatch, inventory, approvals, and auditable workflows—linking control-room decisions to field execution and KPIs

A custom Mistral LLM model is fine-tuned on the utility’s historical faults, switching logs, protection events, and operator notes to improve local root-cause and restoration guidance. Example: it learns that a specific relay + feeder signature usually indicates vegetation contact and suggests the fastest safe isolation and patrol plan, tailored to local network topology and naming conventions. Fine-tuning supports it by boosting accuracy on rare events, abbreviations, and utility-specific procedures beyond generic models.

Real-time resilience
Approach
- Operations Assistant -

Outage playbooks
Approach
- Safety Lead Copilot -

Workforce execution
Approach
- Field Service Copilot -

Faster restoration
Approach
- Grid Reliability Support -

Sales & Marketing: Campaign Management

Problem Statement: Campaign management must plan, design, execute, and supervise campaigns across territories while proving impact. The challenge is to turn performance and brand insights into the right territory selection and compliant collateral, coordinate approvals and content requests, activate sales engagement, track conversions end-to-end, and continuously adjust campaigns without delays or inconsistent messaging.

With Microsoft AI Foundry, agentic analytics combines CRM, web, and sales performance to recommend the best territories, audiences, and offers, then generates draft collateral packages. Example: it finds Territory North has high churn risk and proposes a retention campaign with 3 creative variants and predicted lift. AI Foundry supports it with governed data pipelines, agent orchestration, RAG over past campaigns, and evaluation to compare variants before launch.

With Microsoft 365 Copilot Studio, a “Campaign Intake & Approval Copilot” in Teams manages content requests, routing, and bottlenecks. Example: Sales requests a new flyer; the copilot asks for required details, assembles a brief, pulls approved claims and brand assets, and triggers an approval workflow with reminders. **Copilot Studio supports it** via low-code conversational flows, SharePoint/Power Automate connectors, and controlled actions so approvals and audit trails stay consistent.

Using Microsoft Dynamics, campaign execution becomes closed-loop across marketing and sales. Example: a campaign is distributed to a segment, leads are scored, sales gets prioritized follow-up tasks, and conversion is tracked back to the content and territory—then budgets and targeting are adjusted automatically. **Dynamics supports it** with unified customer data, journey orchestration, lead/opportunity tracking, and dashboards that link engagement → pipeline → revenue, so supervision and adjustments happen continuously.

A custom model fine-tuned on your best-performing campaigns, brand tone, and compliance rules generates on-brand content and flags risky wording. Example: it rewrites an email subject line to match your style guide, inserts approved disclaimers, and warns if a claim exceeds policy. **Fine-tuning on Mistral AI models supports it** by learning your brand voice, product vocabulary, and regional constraints, improving consistency beyond generic LLM outputs.

Real-time resilience

Brand Compliance
Approach
- Compliance Support -

Human Resources: Recruiting workflows and HR chatbots

Problem Statement: Recruiters and HR staff are overwhelmed by manual hiring tasks (scanning resumes, scheduling interviews) and repetitive employee queries, leaving less time for strategic talent development. AI can automate recruiting workflows (resume screening, interview scheduling, candidate Q&A) and power HR chatbots and analytics, improving hiring efficiency and employee support.

Deploy an AI-powered recruiting system using Azure agents to automate tasks like resume review, interview scheduling, and answering HR FAQs. Integrating Microsoft Fabric can further analyze employee data to identify engagement or turnover risks, streamlining hiring and HR processes efficiently.

With Microsoft 365 Copilot Studio, an HR Assistant in Teams answers repetitive employee questions and completes simple workflows.
Example: "How do I request parental leave?" It replies with the approved policy, links the form, and triggers a Power Automate step to open a case if needed. Copilot Studio supports it via low-code conversational design, connectors (SharePoint/HR portals), guardrails, and human handoff for sensitive topics.

Integrate Copilot with Dynamics 365 Human Resources recruiting becomes closed-loop from candidate to hire with automation across scheduling, feedback, and approvals.
Example: once a candidate is shortlisted, the system proposes interview panels, schedules calendars, collects structured scorecards, and routes offers for approval while tracking time-to-hire and drop-off reasons. Dynamics supports it with a unified process and data model, workflow automation, role-based access, and dashboards for compliance and performance.

A custom model fine-tuned on your past hires, internal job architecture, and competency language produces consistent interview questions and candidate summaries tailored to your company.
Example: it generates role-specific structured questions, maps answers to competencies, and drafts fair, defensible notes in your standard format. **Fine-tuning on Mistral AI models supports it** by learning your taxonomy, tone, and regional policy constraints beyond generic LLMs.

Talent Operations
Approach
- Recruiter Assistant -

Employee self-service
Approach
- HR Copilot -

End-to-End Hiring
Approach
- Recruiting Agent -

Consistent Hiring
Approach
- Hiring Support -

Problem Statement: Software developers and IT support teams contend with repetitive tasks (boilerplate coding, code reviews, routine support tickets) that consume time and slow innovation. Generative AI can serve as a coding co-pilot to accelerate development (auto-writing code, tests, documentation) and as an autonomous assistant in IT operations (auto-resolving common issues and analyzing system logs), improving productivity and system reliability.

Use Azure and GitHub to transform software development with agentic AI. Design use cases for AI automation, develop AI agents, and integrate them into GitHub workflows.

Microsoft 365 Copilot helps developers and IT managers by summarizing emails and chats, creating draft documents from meetings, and enabling custom assistants. It also allows non-developers to build apps and dashboards with natural language Q&A and virtual agents for support.

Integrate AI into project management and IT support by using tools like Copilot with D365 or Azure DevOps to track progress, predict delays, and manage resources. In IT service, AI can summarize tickets, suggest solutions, and draft responses, improving response times and system oversight.

Train a custom Mistral LLM on the client's industry terminology, client's code, documentation, and runbooks using Azure. This tailored model, deployed on Azure, serves as a private assistant that understands the company coding style and architecture, helps improve GitHub to generate code, debug errors, and answer troubleshooting questions.

Procurement: Compliant sourcing to execution

Problem Statement: Procurement must run fair, compliant sourcing while balancing cost, risk, quality, and supplier relationships. The challenge is to manage RFPs and supplier Q&A, compare and negotiate bids, ensure contracts follow standard clauses, and convert awards into controlled purchasing and performance tracking—fast, auditable, and with minimal rework across procurement, legal, and finance.

Using Microsoft AI Foundry, agentic procurement analyzes supplier performance, risk signals, and bid history to recommend the best sourcing strategy and negotiation levers. Example: for a packaging RFP, it compares bids, flags hidden cost drivers, and suggests target pricing and alternates based on past awards and market indices. **AI Foundry supports it** with governed data ingestion, agent orchestration, RAG over contracts/RFPs, and evaluation to justify recommendations with evidence.

With Microsoft 365 Copilot Studio, a “Supplier & Bid Intake Copilot” standardizes supplier Q&A and bid submissions. Example: suppliers ask clarifying questions; the copilot answers from the official RFP pack, collects missing documents, and routes exceptions to legal or engineering. **Copilot Studio supports it** via low-code conversational flows, connectors (SharePoint/Power Automate), secure document handling, and guided checklists that reduce back-and-forth and improve compliance.

Using Microsoft Dynamics, procurement recommendations become executable processes across purchase orders, approvals, and supplier collaboration. Example: once a supplier wins, the system generates the contract package, creates POs, enforces approval thresholds, tracks delivery/performance KPIs, and logs issues for supplier scorecards. **Dynamics supports it** with end-to-end workflows, supplier master data, spend tracking, and auditable controls—linking bids to purchasing execution and ongoing supplier management.

A custom model fine-tuned on your clause library, past negotiations, and category-specific specs drafts and redlines contracts and summarizes bids in your preferred format. Example: it proposes fallback positions for liability and SLA clauses and highlights non-compliant bid language with suggested edits. **Fine-tuning on Mistral AI models supports it** by learning your playbook, terminology, and risk appetite—improving consistency beyond generic LLMs.

Technology / IT: AI-powered Employee Experience

Problem Statement: Employees still face fragmented, manual, and inconsistent support experiences across IT, workplace, and learning services. Repetitive tasks and disconnected systems slow productivity and limit personalization. AI-powered, multimodal, and proactive agents are needed to unify onboarding, workplace interactions, and knowledge access into a seamless, anticipatory employee experience.

Develop a unified onboarding AI agent that follows the procedures detailed in the Knowledge article (Agentic Contract), clearly outlining the steps and tools involved. The system should provide users with proactive prompts to initiate the onboarding process, while also allowing them to start it manually if preferred. The agent must apply different agentic contracts based on the user's profile; for example, employees in Sales will undergo a different onboarding sequence than those in Engineering. This agent will be used for onboarding employees both to the company and to new roles within it.

Create a Smart Spaces AI agent with Copilot Studio or Foundry that connects to Exchange and/or Microsoft Places to assist users in locating and reserving meeting rooms or desks. The search and booking process should consider factors such as equipment availability, location, and other relevant criteria. The agent should use dynamically generated adaptive cards to improve the user interface and overall experience. After a room or desk is reserved, the agent should also offer directions to the office or location.

Develop a multimodal "Microsoft Learn Knowledge Agent" using Copilot Studio or Foundry that integrates both voice and chat channels within a single Microsoft Teams application. This AI-powered agent will access information from the publicly available Microsoft Learn MCP server to answer user questions, seamlessly transitioning between chat and voice interactions while preserving conversational context. Furthermore, the agent should create a short assessment consisting of several questions and suggest appropriate Microsoft Learn resources by generating a personalized learning path to assist users in enhancing their skills in their chosen fields.

Develop an Employee Experience Orchestrator AI Agent using Microsoft Agent Framework or Copilot Studio that will integrate the Unified Onboarding Agent, Smart Spaces Agent, and Microsoft Learn Knowledge Agent (or their equivalents) into one comprehensive solution aimed at offering employees a seamless experience and unified access point. The agent should support both dynamic and deterministic journeys/orchestration options.

BYO Client Use Case

Teams are invited to involve the client directly during the hackathon. The goal is simple:

Clients bring a business challenge or use case, and our Capgemini team will build a prototype to validate its feasibility using Microsoft technologies.

WHAT DO THEY GET

- Experiment with AI Agents to solve their business challenges free of charge.
- A working prototype (not production-ready) solving the challenge
- A view of feasibility, risks, and technical approach
- A summary of what was built
- The source code, ready to be used. The IP will be theirs.
(Note: Capgemini will take NO responsibility for how the prototype or code is used afterwards.)

WHAT DO WE NEED

- The participation expected from the clients is designed to be minimum to make it compatible with their daily obligations.
- Share a use case or challenge
- Help our team understand the functional details and expected business value
- Give feedback during the functional and technical design phases

HOW DO WE COLLABORATE

- The participation expected from the clients is designed to be minimum to make it compatible with their daily obligations.
- Due to licensing and legal constraints, clients are not allowed to participate directly in the hands-on implementation itself but are welcome to review and comment on:
 - The Design
 - The functional approach
 - How well everything aligns with their needs
- No need to provide data. In case they want to share data to get more accurate results it must not include any personal or sensitive information
 - You'll need to confirm that Capgemini has no liability for the data used during the exercise
- Participation will not be publicly disclosed.
- Costs are fully covered:
 - Microsoft covers platform and training
 - Capgemini covers the implementation

TRAINING

Instructor led

For all that register there is an opportunity to join one of the Microsoft Foundry instructor led trainings.

All that register will receive an invite to register.

Availability is on first come first serve.

We plan 2 sessions:

- APAC + India time zone
- Europe + Americas time zone

Based on needs we maybe can plan one more.

PROJECT READY

Home > Azure > Innovate with Azure AI Apps and Agents > Azure AI Foundry

Available

EN | DE | FR | ES | PT | JA | KO | ZH

Build AI apps and agents with Azure

This course is designed for professionals who want to deepen their expertise in leveraging Microsoft Foundry to build, deploy, and manage sophisticated Generative AI apps and agents. Participants will explore advanced concepts, best practices, securing and governing the AI Solutions and real-world applications of GenAI apps and agents, gaining hands-on experience with the platform's powerful tools and capabilities.

Duration: 3 Days (4 hrs/day)

Level: Intermediate

Hands on Labs: Yes (Skillable)

Course Prerequisites: Basic AI concepts understanding, Familiarity with Python development

Target Audience: Technical, Developers

Suggested Supplementary Certification: AI-102

Suggested Applied Skills Assessment: [Develop generative AI solutions with Azure OpenAI Service](#)

Last Refreshed: Jan 2025

LMS Availability: [Yes](#)

Day 1 - Architect enterprise AI solutions with Microsoft Foundry

Module 1: Foundations of AI & agentic architecture

- Architect enterprise solutions with Agentic AI
- AI apps and agents - concepts, roles, and behaviors
- Choose the right approach to build apps and agents

Module 2 — Accelerate innovation with Microsoft Foundry

- Microsoft Foundry for enterprise AI and agents
- Microsoft Foundry SDK for app & agent development
- Build AI apps and agents that scale - Foundry Agent Service
- Understand Responses APIs
- Power your agents with the Microsoft Foundry model suite
- Optimize model selection with the Model Router
- Develop apps and agents with Azure OpenAI

Module 3: Build multi agent apps and agents with Microsoft Agent Framework

- Microsoft Agent Framework - The open-source engine for Agentic AI apps
- Microsoft Agent Framework workflows

Hands on labs

- Use case 1 - Developing Multimodal AI Applications for Image Classification
- Use case 2 - Modernize your code with agents with Microsoft Foundry
- Use case 3 - Prototyping multimodal agents with Microsoft Foundry and the AI Toolkit

Day 2 - Scale and orchestrate custom AI agents and applications

Module 4: Drive business results with action-oriented, context-aware agents

- Combine intelligence across Work IQ, Fabric IQ and Foundry IQ
- Empower agents to act using Foundry Tools
- Azure AI Search essentials
- Understand classic search
- Understand agentic retrieval
- Enhance your search with Foundry IQ
- Native Azure AI Search Indexing in Foundry
- Retrieval-Augmented Generation (RAG) for accurate & trusted responses
- Custom model adaptation with fine tuning Techniques
- Understand Retrieval-Augmented Fine-Tuning
- Understand distillation and synthetic data generation

Hands on labs

- Use case 4 - Deploying and Testing a Custom Chat Application with PostgreSQL
- Use case 5 - Developing Intelligent Chat Applications with Azure RAG(Using Python)
- Use case 6 - Develop an AI-Powered Copilot for Financial Advisors with Microsoft Foundry

Day 3 - Build safe and compliant AI agents with Microsoft Foundry

Module 5: Agent observability, security and governance with Microsoft Foundry

- Build generative AI workloads with Well-Architected Framework
- Foundry Control Plane - Govern the AI lifecycle with observability and controls
- Continuously monitor and evaluate your agents
- Understand the AI Red Teaming Agent
- Understand Agent tracing overview
- Ensure safe AI outputs with Azure AI Content Safety
- Microsoft Agent 365 - the control plane for agents
- Secure access for AI agents with Microsoft Entra ID

Hands on labs

- Use case 07- Safeguard your agents with AI Red Teaming Agent in Microsoft Foundry
- Use case 08-Moderate text and images with content safety in Azure AI Content Safety Studio
- Use case 09- Building Video Generation Workflows using Sora Model
- Use case 10: Deploying and Evaluating Fine-Tuned GPT Models in Azure AI Projects

Presentation Title | Author | Date

TRAININGS

Self-paced training

For all there is a variety of self-paced trainings available with hands-on labs on all provided technologies.

All that registered will get a link to sign up for one or more trainings to upskill and be ready to implement.

Topics covered will be:

- Copilot Studio
- Microsoft Fabric
- GitHub Copilot
- Dynamics Copilot's

Be ready to combine them all

PROJECT READY

Home > Azure > Innovate with Azure AI Apps and Agents > Azure AI Foundry

Available

EN | DE | FR | ES | PT | JA | KO | ZH

Implement with impact
Accelerate
Agentic AI

This is a comprehensive learning journey designed to rapidly equip professionals with the skills needed to effectively build, demonstrate, and deploy powerful AI-driven agents. From creating essentials using Microsoft Copilot Studio and SharePoint agents to advanced multi-agent development leveraging Azure AI Foundry, Autogen, Semantic Kernel, and Microsoft Teams SDK, participants will progressively gain deep, practical insights. Attend this workshop to master key AI concepts, accelerate your organization's AI capabilities, and confidently architect, deploy, and scale sophisticated AI agent solutions.

Day 1: Showcasing AI Potential with Agentic AI

Day 2: Architecting Success with Multi-Agent AI Systems

Day 3: Multi-Agent AI: Orchestrating and Experimenting with Azure AI Foundry

Day 4: Enterprise-Grade Optimization and Production at Scale

Module 1: Innovate with Microsoft Copilot and agents

Module 2: Extend Microsoft 365 Copilot with Agents

Module 3: Innovate with Azure AI in Copilot Studio

Module 4: Innovate with Azure AI Platform

Module 5: Customise, orchestrate and experiment with Azure AI Foundry

Module 6: Build your own multi-agents with Semantic Kernel or Autogen

Module 7: Enterprise-grade production at scale

Module 8: Advanced AI risk evaluation and mitigation

Duration: 4 days (5 hrs/day)

Level: Intermediate - Advanced

Hands-on Labs: Yes (Optional)

Course Prerequisites: Generative AI Fundamentals

Target Audience: Presales-Technical

Suggested Supplementary Reference: Develop generative AI solutions with Azure OpenAI Service

Suggested Applied Skills Assessment: ESI Course Code: DW-200

Last Refreshed: May 2025

Implement with impact
Build and extend your agents using pro-code capabilities with the Microsoft 365 Agents Toolkit and Copilot Studio

In this workshop you will learn how to extend the Microsoft 365 Copilot and to build/develop your own agents using pro-code techniques with Microsoft 365 Agents Toolkit and Copilot Studio. It analyzes all the available pro code options to build your own agents.

Day 1 - Build and connect your agents to Microsoft 365 Copilot using pro-code capabilities

Day 2 - Build your agents using pro-code capabilities with Copilot Studio and Agent control and governance

Module 1: Build agents for Microsoft 365 Copilot

Module 2: Build your agents using pro-code capabilities with Copilot Studio

Module 3: Implement agent control and governance

Duration: 2 Days (4 hrs/day)

Level: Intermediate

Hands-on Labs: Yes (Skillable)

Course Prerequisites: Familiarity with Copilots and agents and basic programming knowledge

Target Audience: Developers

Suggested Supplementary Certification: PL-400

Suggested Applied Skills Assessment: Create Agents in Microsoft Copilot Studio

ESI Course Code: DW-104

Last refreshed: Sept 2025

LMS Availability: Yes

PROJECT READY

Home > AI Workforce > Copilot and Agents at Work

Implement with impact
Unlock AI Powered Future Work with Microsoft 365 Copilot + agents

Microsoft 365 Copilot is an AI-powered productivity tool that uses large language models (LLMs) and integrates your data with the Microsoft Graph and Microsoft 365 Apps. In this course you will learn how Copilot provides real-time intelligent assistance, enabling users to enhance their creativity, productivity, and skills.

You will learn about technical requirements to access and configure Copilot in your organization and how you can extend it using plugins.

Day 1

Day 2

Day 3

Accelerate AI Transformation with Microsoft 365 Copilot

Build your own agents

Governance, visibility and cost controls

Hands-on Labs

Hands-on Labs

Hands-on Labs

Duration: 3 days (4 hrs/day)

Level: Intermediate

Hands-on Labs: Yes (Skillable)

Course Prerequisites: AI Questions, Answer Content, and Transform Documents with Microsoft 365 Copilot in Word

Target Audience: Technical

Suggested Supplementary Certification: MS-900, AI-900

Suggested Applied Skills Assessment: Create Agents in Microsoft Copilot Studio

ESI Course Code: DW-101

ESI Course Code: DW-101

ESI Course Code: DW-101

Last refreshed: Oct 2025

LMS Availability: Yes

PROJECT READY

Home > Azure > Innovate with Azure AI Apps and Agents > GitHub

Available

EN | DE | FR | ES | PT | JA | KO | ZH

Implement with impact
Accelerate Azure Development with GitHub

This course empowers developers and DevOps engineers to master Agentic DevOps using GitHub Copilot, GitHub Advanced Security, and Azure integrations. Participants will learn to build and extend AI agents with Copilot, secure code and supply chains using GitHub Advanced Security, and accelerate app modernization with Azure AI Foundry. Through hands-on labs, they'll gain practical skills in Copilot development, Copilot extensibility, secure development, and integrating AI into cloud-native workflows.

Day 1

Day 2

Day 3

Module 1: Agentic DevOps with GitHub

Module 2: Secure Code with GitHub Advanced Security

Module 3: Agentic DevOps with GitHub Copilot

Module 4: Accelerate App Modernization and Azure development with GitHub Copilot

Hands-on Labs

Hands-on Labs

Hands-on Labs

Hands-on Labs

Duration: 3 Days (4 hrs/day)

Level: Intermediate

Hands-on Labs: Yes (Skillable)

Course Prerequisites: Bring your own GitHub Copilot license or free version of GitHub Copilot LLa

Target Audience: Technical

Suggested Supplementary Certification: AZ-900, GitHub Copilot

Suggested Applied Skills Assessment: Accounts app development using GitHub Copilot

Last Refreshed: June 2025

LMS Availability: Yes

Training dates and details

During the hackathon there are various trainings available. It is strongly recommended to follow one or more.

Build AI Apps and agents with Azure

Live Instructor Led: [Build AI Apps and agents with Azure | Microsoft Partner Skilling Hub](#)

- March 17–19, 2026 | 8:00 AM – 12:00 PM | ASIA (IST)
- March 18–20, 2026 | 8:00 AM – 12:00 PM | EMEA (GMT) & AMER (PDT)

Accelerate Agentic AI

Industry Office Hours - dates

The **Industry Office Hours** have been scheduled. Make sure you attend those that are relevant to you
We have already scheduled the office hours for the **following industries**:

- **Wednesday 25th** at 12:00 CET we will have the **Life Science** industry leaders,
<https://teams.microsoft.com/meet/32430309402409?p=qZY8Szu5E0lixJJSmR>
- **Wednesday 18th** at 15:00 CET we will have the **CPR** industry leaders,
<https://teams.microsoft.com/meet/38706849337731?p=74EkOzCMozcREyBtGl>
- **Thursday 19th** at 15:00 CET we will have the **Public Sector** leaders,
<https://teams.microsoft.com/meet/37193164864271?p=r9yXXe3vUFlA3oWYHg>
- **Friday 20th** at 14:00 CET we will have the **E&U** industry leaders,
<https://teams.microsoft.com/meet/39329846600705?p=jbrorvLMKOL4Myzbagg>

Join this session to hear our Industry Leader's perspective on the most important business challenges where AI can create meaningful impact.

The discussion will also provide an opportunity for all of you to raise the use cases you are currently exploring, receive expert feedback, and get practical guidance on how to shape and prioritize them for business value.

It's your session so I encourage you all to come and ask as many questions as you might have.

See you there!!!

High-level process

Learning moment and learning hours

INSTRUCTIONS

How to use this template

SLIDE TO BE REMOVED ONCE COMPLETED

The purpose of this template is to provide a guidance of the key elements that need to be covered by the different teams who participate in the [Microsoft Agentic Industry Hackathon 2026](#) initiative.

The whole initiative starts with an idea: [How we can use AI Agents to improve the business.](#)

Once the idea is clear, use this template to define and design the Use Case around it so it can be evaluated by the Microsoft Agentic Industry Hackathon 2026 judging team who will [decide which ones are the best ones](#) to move to the implementation phase. To evaluate each idea, it must come with the elements described in this deck, so apples can be compared with apples.

There are [4 key elements](#) to be described:

- Use Case **description** from functional and business perspective:
- Business **Process** of which the Use Case is part of and what part of the process is covered by the Use Case
- Business **Case** to implement it.
- High Level **Solution** from Functional and Technical perspective

The following slides will allow you to provide the necessary content. All the content included is provided as an example. Please update the template master to include the name of the process and update the content accordingly.

Good luck!

USE CASE AND ARCHITECTURE TIPS

There will continuous office hours and support from Capgemini industry experts and Microsoft Partner Solution Architects

Use Case

To ensure every hackathon project delivers meaningful impact, teams must have a use case across several key dimensions that drive business value and responsible innovation.

This framework helps assess whether a proposed AI solution is not only creative but also feasible, scalable, and aligned with real user needs.

-
1. Problem Significance – Is this an important problem?
 2. User Impact – Who benefits and how much?
 3. Innovation – What's new or creative here?
 4. AI Fit – Is AI the right tool for the job?
 5. User Experience – Is it simple and intuitive?
 6. Responsible Design – Are safety and ethics addressed?
 7. Feasibility – Can it realistically be built now?
 8. Scalability & Security – Can it scale securely?
 9. Reusability (MCP) – What parts can be reused elsewhere?
 10. KPI Impact – What measurable value will it deliver?

Architecture

This validation highlights whether the proposed design uses the right capabilities of Azure, Microsoft Fabric, Microsoft Foundry, GitHub Copilot, M365 Copilot Studio, and Dynamics Copilot and aligned with the Well-Architected Framework.

The architecture will directly feed into provisioning the team's hackathon environment, ensuring all required components are correctly configured from the start.

-
1. Clear Architecture Flow – Is the end-to-end design simple and clear?
 2. Platform Fit – Are the platforms used appropriately?
 3. Data & Governance – Is data storage and access well-defined?
 4. Security – Are identity, access, and protection measures in place?
 5. Reliability – Does the design handle failures and recovery?
 6. Performance – Is the solution optimized for speed and efficiency?
 7. Cost Awareness – Are compute and AI resource costs considered?
 8. Scalability – Can the solution grow without redesign?
 9. Integration – Are connections between components defined?
 10. Provisioning Readiness – Does the design list all

Half Finals check Criteria

Use Case and Architecture validation

Teams will be evaluated on *the use case and on the proposed architecture, impact and completeness*

When accepted to the HALF FINALS teams will get the environment envisioned in their design and will be asked to make their implementation for the finals selection.

Architecture (0-10 each):

- ☐ **Clarity & Flow** – *Does the architecture present a clean, easy-to-understand end-to-end flow that clearly shows how components interact?*
- ☐ **Platform Fit** – *Are the chosen Microsoft platforms and services appropriate for the problem and used in the right way?*
- ☐ **Data/Gov/Sec** – *Is data stored, accessed, and governed securely with proper controls, policies, and identity measures in place?*
- ☐ **Reliability/Perf/Cost** – *Is the solution built to run reliably, perform efficiently, and avoid unnecessary consumption or cost?*
- ☐ **Scalability/Integration/Provisioning** – *Can the solution scale smoothly, integrate with required systems, and be provisioned in a consistent, repeatable way?*

Use Case (0-10 each):

- ☐ **Value & KPI Impact** – *Does the use case deliver tangible business or user value with clear KPIs that can be improved or measured?*
- ☐ **Innovation** – *Does the solution introduce a novel, differentiated, or uniquely beneficial approach compared to current ways of working?*
- ☐ **AI Fit** – *Is AI genuinely adding value and used appropriately and responsibly within the solution?*
- ☐ **UX Simplicity** – *Is the user experience intuitive, natural, and easy enough that users can quickly understand and benefit from it?*
- ☐ **Build-Scale-Reuse** – *Is the implementation feasible to build now, scalable in real environments, and able to reuse or contribute reusable assets (e.g., MCP components)?*

Finals check Criteria

Submissions will be evaluated on **the impact and quality of the intelligent application.**

When accepted to the FINALS teams will be asked to make a pitch for the executive leadership judging round. Number #3 #2 and #1 will be announced during a session where all finalists show their results

Per bullet a max of 10 points

Requirements & Architecture Completeness (SDLC)

The team shows a clear end-to-end definition of the solution: problem framing, refined user stories, acceptance criteria, and a complete architecture that reflects the final implementation.

Implementation Quality & Technical Execution (SDLC)

The delivered solution is well-built, maintainable, tested at a reasonable level, and matches the intended design. Code quality, structure, and correctness are visible in the working product.

Platform Excellence & Proper Use of Microsoft Capabilities

The implementation demonstrates effective use of the selected Microsoft platforms (Azure, Fabric, Foundry, GitHub, M365 Copilot Studio, Dynamics Copilot). Components are chosen intentionally and used correctly to strengthen the solution.

User & Business Impact of the Delivered Use Case

The working solution clearly demonstrates the intended impact: solving the defined problem, improving productivity or decision-making, reducing friction, or enabling a measurable business/user benefit.

AI & Automation Value Realization

The final implementation showcases how AI, agents, copilots, or automation create *meaningful* value — improving accuracy, reducing manual effort, accelerating processes, or enabling capabilities that weren't possible before.

Key data

March 2

REGISTRATION OPEN

Register as an individual, investigate use cases, create or join a team in this website: [Capgemini Hackathon](#)

[Look below](#) for a how to guide and ask [any question in the Q&A channel](#)

March 30

SEMI FINALS SUBMISSION WEEK

Work with your team on the Use Case, on the Architecture and leverage optimal Microsoft AI Platforms.

With your team you need to submit (in the portal **IDEA SUBMISSION** tab under your team) your design and architecture ([for ideas see this example collection and this template](#)).

Your design will be validated by Microsoft and Capgemini experts before giving access to the finals and the Hackathon AI platforms.

May 5

FINALS SUBMISSION WEEK

After a full month of implementing the use case, it is time to show the work.

Make with your team a one or two slider with a 5 min video of your solution. Show the value and submit (in the portal go to the **PROJECT SUBMISSION** tab).

Experts from Microsoft and Capgemini will validate and select the top 10.

These 10 will get a notification to prepare a pitch for the EXECUTIVE judging LIVE session.

May 15

The FINALS

Join all in the celebration of the finals, see the top 10 teams perform a rockstar level pitch.

Executives from Capgemini, Microsoft and GitHub will ask some hard questions before the top 3 will be announced.

It will be spectacular

Scheduled Agenda

09	Microsoft Agentic Industry Hackathon 2026 - Meeting
Mar	Mon 2026-03-09 5:30 AM - 6:30 AM 📍 Microsoft Teams Meeting, Teams meeting
11	Microsoft Agentic Industry Hackathon 2026 - Office Hour #1

15	Microsoft Agentic Industry Hackathon 2026 - 🎉🔥 The Agentic Industry Hackathon 2026 FINALS Are Here! 🔥🎉
May	Fri 2026-05-15 4:30 AM - 5:30 AM 📍 Microsoft Teams Meeting, Teams meeting

Registration Goals

INDIVIDUAL REGISTRATIONS

get access to hands-on labs, trainings and finals

3000

TEAMS FORMED

team with 5 or more team members are formed and move to ideation and architecture design

400

TEAMS PASSED IDEATION AND ARCHITECTURE VALIDATION

teams get a hackathon environment, and start implementing and make a **submission** that will be validated for possible selection for finals

250

- 3000 registered – 1500 AI badges – 250 AI + GitHub certifications.
- 400 teams, 250 use case submissions from which 100 are reusable POC's and demos and with the goal to move 25 to industrialized assets.
- 25 client provided use cases from which 10 become real projects

SUPPORT NEEDS

CAPGEMINI UNITS

- C&CA + I&D:
 - 1 or 2 people in the core team
 - Marketing support for internal messaging
 - Define, validate and support use cases
 - Motivate regions to join
 - Onboard Account Execs large clients to join on use case
- INVENT:
 - 1 people in the core team
- Others:
 - FS, Sgti, ERD, CIS etc... motivation

CAPGEMINI GSIP + UNI

- Alliance team:
 - Marketing support for internal messaging
 - Local Microsoft awareness
 - Motivate regions to join
 - Onboard Account Execs large clients to join on BYO use case
 - Teams environment
 - Meeting invites

MICROSOFT (+GitHub)

- Lab environments
- Hackathon environments
- Registration portal (we want to let colleagues register via Capgemini University system, then we have all their data, and send these registrations to the Microsoft registration portal where the can form teams)
- Use Case validation with PSA's
- Trainers
- Proctors
- Executive Judge

Key Team
